#	Problem	Location	Fix	Why the fix matters
1	Missing <!DOCTYPE html>	Line 1	Added <!DOCTYPE html> as the first line	Without it, browsers use "quirks mode" and may render the page inconsistently.
2	Missing document language	Line 1 (<html>)	<html lang="en">	Screen readers need it to pronounce text correctly, and browsers use it for translation.
3	Missing <title>	Lines 2 to 4 (<head>)	Added <title>My Travel Club | Join Our Monthly Trips</title>	The title shows in the browser tab and search results, and is required in valid HTML.
4	Incorrect heading hierarchy: <h3> comes before <h1>	Lines 6 and 7	Replaced them with one My Travel Club followed by Welcome to the club	Headings give the page an outline. Screen reader users navigate by headings, so the order should be logical.
5	Heading level skipped: <h4> with no <h2> or <h3> before it	Line 13	Changed <h4> to <h2>	Skipping levels breaks the outline and confuses assistive technology users.
6	Missing closing tag: is never closed (and the is never closed)	Line 8	Join us for amazing trips this year.	Unclosed tags make the text after them bold by accident and make the structure unpredictable.
7	Incorrect nesting: opened, then closed by , then	Line 10	new places every month.	Tags must close in the reverse order they opened (like Russian dolls). Overlapping tags make browsers guess.
8	Duplicate ID: id="intro" is used twice	Lines 9 and 12	Renamed the second one to id="latest-trip"	IDs must be unique. Duplicates break CSS, JavaScript lookups and anchor links.
9	Meaningful image with no alt text	Line 14	Added alt="Orange sunset over a calm sea..." (plus width and height)	Screen reader users get no description without alt, and alt is required in valid HTML. Width and height stop layout shifts.
10	Broken relative link: gallery/photos.html does not exist	Line 16	Changed to gallery.html (which exists)	Broken links give users a 404 error and hurt trust and navigation.
11	Broken relative link: aboutus.html is a typo	Line 16	Changed to about.html	The file name must match exactly.
12	Form-label association missing: the label has no for	Line 18	<label for="name">Your name</label>	Linking labels to inputs lets users click the label to focus the field and lets screen readers announce it.
13	Incorrect association: for="mail" but the input's id is email	Lines 20 and 21	Changed to <label for="email">	A for value must match the input's id exactly, or the link doesn't work.
